The 2019 Strategy& Digital Auto Report

Time to get real: opportunities in a transforming market
The 2019 Digital Auto Report: addressing market reality

Key facts and main content

- Eighth annual Digital Auto Report, developed by Strategy&
- Global study with a focus on the US, EU and China
- Quantitative market outlook based on detailed research
- Interviews with key industry executives at OEMs and suppliers, leading academics and industry analysts

Chapter 1
New value opportunities

- The search for new business models as technology investment drives up costs
- What are the value opportunities in alternative ownership models?
- How do customers choose between mobility options?

Chapter 2
Market dynamics & technology

- Overview of the current state of connected, autonomous, shared and electric (CASE) technologies
- When will these technologies ramp up?
- How is regulation influencing progress?

Chapter 3
Value chain & capability shifts

- How can suppliers reposition themselves in a transforming market?
- What new organizational structures are required to address hardware, software and services?
- How can auto makers and suppliers close the digital skills gap?
The auto industry’s dilemma: traditional profit pools no longer match the rising level of tech investment required

Summary – the search for profitable new business models

• The total number of cars in use (parc) in Europe is forecasted to peak at 273 million in 2025 and to decline thereafter. The number will continue to increase in China and at a slower pace in the US.

• During the same time period, the cost of vehicle content is going up – electric powertrains and automated features could increase the Bill of Material (BoM) by between 20 and 40 percent by 2030.

• Alternative ownership models and new revenue opportunities for OEMs are required to ensure customer affordability and economic returns for the industry: mobility spending is expected to be worth $1.2 trillion in Europe, the US and China by 2030, growing by more than 20 percent a year.

• There will be a significant shift in value pools as OEMs and suppliers search for new business models. We estimate that profit share from traditional car sales, parts and aftersales will shrink from 70 to ~55 percent of total automotive market, while non traditional player profit shares could raise from 5 to ~25 percent by 2030.

• As a result, intense efforts are needed by suppliers and OEMs to drive down technology costs in the coming decade – a reduction of 65 to 75 percent of costs for advanced driver assistance systems (ADAS), for example.
Connected, automated, shared, electric: what’s driving the pace of digital change?

Summary – technical readiness, consumers, regulation and economics dictate transformation speed

- **Connected**: sales of 5G enabled vehicles are expected to reach **16 million in the EU, US and China by 2030**. However, we believe connected services mainly make a positive contribution to user experience with little potential for OEMs and suppliers to make money directly from connectivity.

- **Automated**: we still expect people movers with Level 4 autonomy to be operating in restricted areas at less than 50km/h by 2021, however we expect a delay until **2029 in highly automated Level 4/5 vehicles making it on to the road**.

- **Shared**: our research shows that **47 percent** of European consumers would consider giving up their own car in favor of widely available and adequately priced autonomous robo-taxi services.

- **Electric**: by **2030, 46 percent of new car registrations in China will be for electric vehicles**. In Europe the figure will be 40 percent and in the US 35 percent. Internal combustion engines (ICE) still have the advantage when it comes to range, with only premium-priced fuel-cell electric vehicles able to compete.

These changes have fundamental implications for OEMs and their suppliers. OEMs need strategies to reduce their R&D costs through partnerships, and to focus on developing new ideas while outsourcing non-core back-office, R&D and technology solutions.

We also believe five new sustainable roles for suppliers will emerge: as smart infrastructure enablers; automated shuttle-vehicle manufacturers; platform providers; mobility intelligence providers; and vehicle feature and demand providers.

Finally, new flexible and hybrid organizations need to be created, and due to the scarcity of people with the right skills, the auto industry must upskill its existing workforce to perform digital and data-management roles.
1

New value opportunities: alternative ownership models
New technologies add significantly to vehicle costs while infrastructure could become bottleneck for user adoption

Electric and automated features are the biggest cost drivers

<table>
<thead>
<tr>
<th>CONNECTED</th>
<th>ELECTRIC</th>
<th>AUTOMATED</th>
<th>SHARED</th>
</tr>
</thead>
<tbody>
<tr>
<td>BoM(^1) cost increase(^2)</td>
<td>+2-3%(^3)</td>
<td>+12-16%</td>
<td>+12-22%</td>
</tr>
</tbody>
</table>

**Business model challenges**

- **Connectivity** now required by regulation and safety standards
- Fast erosion from perceived premium to commodity experience
- Willingness to pay declining among customers
- Low connected services renewal rates
- Investments in electric car architecture increase costs
- Low revenue margins due to high development costs
- Missing regulation for technological and geographical expansion of charging infrastructure
- Additional cost elements being added to ADAS systems
- Economic challenges hinder global roll-outs of AV systems
- Fewer acquisition targets available to extend technological expertise
- Increase in inter-company co-operation to distribute additional development costs
- Ride-hailing providers still unprofitable
- Leading car-sharing providers have withdrawn from unprofitable cities
- Car manufacturers depreciate initial investments
- Asset utilization not sufficient to generate meaningful returns

**Infrastructure challenges**

- Cost and timing of high-speed mobile network (5G) coverage
- Availability of infrastructure-to-vehicle communications
- Alternatives to GPS (high precision)
- Availability of high-speed electric charge points
- Availability of bidirectional charging solutions
- Availability of hydrogen fueling network for fuel cells
- Availability of driving zones
- Regulation for operating alongside traditional traffic (pedestrian, bike, car, van)
- Limited downtown real estate space for charging & overhaul
- Cross-provider user authentication
- Integration with other modes of transport
- Regional and urban availability

---

1) BoM = Bill of material  2) BoM increase until 2030 compared to today’s base vehicle (13,500€) excluding connectivity solutions  3) connected and shared analyzed together as highly correlated, hence 2-3% BoM increase estimated considering both connected and shared shift together | Source: Strategy& analysis
Number of cars in use will likely peak in the EU by 2025 – continued growth in China and the US

Shared mobility will impact the total number of vehicles in use

Total vehicle parc (in millions. Autonomous, connected, electric as percentage of total vehicle parc)

- Declining car parc in EU due to increase of shared mobility & integrated mobility platforms
- Delayed roll-out of shared mobility pushes car parc in US and China in line with growth of total mobility demand
- In China, parc projection may exceed sustainable levels
Regulation as well as innovation could raise vehicle bill of material cost by 20-40%.

Regulatory requirements push installation of enhanced connectivity, automation, and electrification.

• Addition of basic connectivity for emergency response in accordance with NCAP safety requirements
• Addition of basic L1-L2 ADAS to accord with NCAP safety requirements
• Switch from ICE to BEV
• Addition of advanced connectivity/head-unit-to-host connected services and enable (for example) vehicle usage for shared mobility
• Addition of advanced L4 ADAS as enabler for autonomous driving
• Powertrain changes due to environmental requirements have the largest cost impact from a regulatory viewpoint
• Enabling vehicles to earn additional revenues from connected or automated features adds further margin pressure to the vehicle BoM, to be recovered via vehicle price or services contribution
• Intense effort necessary by suppliers and OEMs to drive down technology costs by 2030 – e.g. reduction of 65-75% for ADAS – to reach profitability

Note: Bill of material indexed to 100% in 2018 | Source: Strategy& analysis
Auto industry revenues keep growing – but profitability shifts away from traditional profit pools

Significant shifts in global automotive value pools

Revenue distribution¹ (in $bn)

Profit distribution¹ (in $bn)

Key levers

- Mobility as a Service (MaaS) increases vehicle utilization and vehicle wear and tear, leading to higher parts sales but a declining share of vehicle sales
- MaaS fleet owners emerge as an important new group of buyers, with higher bargaining power, leading to lower margins in aftermarket, financing and insurance
- Autonomous features increase vehicles’ technical complexity, and the share of value provided by new tech suppliers. However, there are fewer collisions, cutting insurance and aftersales demand
- Electric powertrains are less complex than ICE equivalents and need less maintenance, which reduces traditional supplier revenue streams

1) Based on Strategy& 2030 Scenario. Totals may not equal sums shown due to rounding 2) Vehicle-based mobility as a service, including “shared autonomous” and “shared driver-driven”  |  Note: Consolidated view; supplier value pools not eliminated from vehicle/aftermarket/MaaS revenues to show full industry value pools

### Notes:
- **1**) Pooled shuttles shared with multiple people
- **2**) TCM = total cost of mobility for end user in Germany incl.: asset (mid-sized car), insurance, maintenance and gas; assumptions: mode 2: average of leasing offers 15,000km yearly, 24 months, mode 3: average of current subscription offers, mode 4: average of rental offers 15,000km yearly, 24 months, mode 5: typical city trip, mode 6: typical city trip by taxi, mode 7: typical city trip, mode 8: average of current micro-mobility offerings (e-scooter)
- **3**) Best view generated based on respective annual reports, newspapers and expert input
Car ownership will continue to shift away from private owners

Further increase of alternative ownership is expected

Customer demand for mobility services is increasing:

74 percent of consumers opt for the most convenient way of getting from A to B, including using more than one mode of transport

28 percent of European vehicle owners could imagine earning money from sharing their car via a peer-to-peer platform

47 percent of European consumers would consider giving up their own car in favor of widely available and adequately priced autonomous roboto-taxi services

>50 percent of consumers would be willing to pay up to $250 for a monthly subscription for unlimited rides within town

Passenger vehicle registrations by customer group – Germany

**CAGR 2018-30**

+31%

**Comments**

- The global shift to alternative / shared ownership is heavily dependent on the achievable price points / cost per kilometer in each market
- After initial price battles to gain market share, mobility providers will have to reach profitability to survive, despite their intensive cost base
- Long-term decrease in the cost of shared mobility operations depending on the individual operator’s capabilities
- Split of market into few global players and substantial long-tail of local players with specialized offers expected

---

Note: vehicle-based Mobility as a Service, incl. “shared autonomous” and “shared driver-driven”; based on Strategy& 2030 scenario
Source: PwC AutoFacts®, Strategy& analysis
New mobility models are expected to account for 17 - 28% of vehicle-based mobility globally by 2030

**Definitions**

- **Individual Active Mobility**: Use of individually owned, driver-driven car (private car, family car, personal company car, etc.)
- **Shared Active Mobility**: Using all forms of shared mobility with an active driver (rental, car sharing, ride hailing, ride pooling, taxi, etc.)
- **Individual Passive Mobility**: Provided by cars with capability to drive automated, without driver intervention (private car, family car etc.)
- **Shared Passive Mobility**: Provided by all forms of shared mobility with a fully automated vehicle (ride hailing, robotaxi, people mover etc.)

Note: Figures may not sum up to 100% due to rounding.

However, alternative mobility models continue to cannibalize each other

Customers will seek the best service and greatest convenience

| Shift 1: Customers might shift from leasing to subscription models for a better service offering and convenience |
| Shift 2: Customers might shift from car sharing towards ride hailing / ride sharing as price levels converge |
| Shift 3: Customers might shift towards micro-mobility for very short urban distances, due to time and cost savings and first and last-mile convenience |

Future shifts expected as of today

 Strategy\& PwC

1) TCM = total costs of mobility for end user in Germany incl. asset (mid-sized car), insurance, maintenance, and gas; assumptions: for mode 2: average of leasing offers, 15,000km yearly, 24 months, for mode 3: average of current subscription offers, for mode 4: average of rental offers 15,000km yearly, 24 months, for mode 5: typical city trip, for mode 6: typical city trip by taxi, for mode 7: typical city trip, for mode 8: average of current micro-mobility offerings (e-scooter) 2) Pooled shuttles shared with multiple people | Note: OD: one-directional, MD: bi-/multi-directional
In cities, customers will assess their ride choice on a journey-by-journey basis

Example: Anna is late for a meeting in the city center, it’s raining. What mobility service suits her best?

1) Perceived importance and preference based on individual perceptions and ever-changing situational use cases
2) Selective evaluation of three mobility modes on their applicability and hence competitiveness level within each criteria
3) TCM = Total cost of mobility

Ride hailing matches Anna's current preferences best. Comfort and availability are the factors, where ride hailing has a clear advantage over car sharing and ride sharing, especially when price parity will be achieved.
2 Market dynamics & technology
What are the key drivers for new forms of mobility?

Change happens rapidly once favorable economics are achieved

Illustrative ramp-up curves

Penetration drivers

1. **Technology**
   - Technical readiness occurs when a technology is applicable to sufficient share of targeted use cases, marking the starting point of adoption.

2. **Customer demand**
   - New, superior technology is quickly adopted by premium users as high costs are not prohibitive to them. However, penetration stagnates at 5-15% due to limited customer segment size.

3. **Regulation**
   - Regulation plays a role by defining certain technology components as mandatory (e.g., the eCall system, which automatically places an emergency call after a crash, is mandatory in the EU since 2018).
   - However, penetration only increases in line with new car registrations and often remains below the total global market (due to regional scope).

4. **Economics**
   - Once a technology results in superior economics due to lower costs or additional revenues, the pace of adoption is exponential.
   - However, typically a certain level of volume is needed first, before cost parity to alternatives is reached.

Source: Strategy& analysis
Transformation will happen at varying speeds globally

Key considerations to anticipate tipping point of exponential technology adoption

<table>
<thead>
<tr>
<th>Technology</th>
<th>Consumer</th>
<th>Regulation</th>
<th>Economics</th>
</tr>
</thead>
</table>
| **Connected** | • Viable car system capability and EE architecture  
• 3G coverage must be >95% | • Share of people paying extra for  
– Premium services  
– Experience (e.g. AR windshield) | • Superior economics  
– Cheaper OTA vs. OBDII updates  
– Low usage-based fees vs. fix rates |
| **Electric** | • Electric powertrain performance  
• Charging network availability (>80% coverage in urban areas) | • Consumer preference for  
– Acceleration  
– Sustainability  
– Operating cost | • Superior total cost of ownership (TCO) of BEV vs. ICE  
[at mid-range for volume segment] |
| **Automated** | • Coverage of a vehicle’s operating driving domain (>75% at 50km/h)  
• 4G/5G network coverage | • Share of users paying extra for:  
– “Having it first”  
– Letting tech do the driving | • “5th screen” revenues  
• Superior TCO & lower price  
[in taxi/hailing mode] |
| **Shared** | • Smartphone penetration (>70% of population)  
• International/ intermodal roaming | • Share of people willing to give up own car in urban areas (>40%) | • Superior cost vs. own vehicle (>20% cheaper) |

[Assumed moment of truth / penetration before reaching tipping point of transformation]

1) EE = electric/ electronics  
2) OTA = Over the Air; OBDII = On board diagnosis interface

### Comments

**Revenues** from vehicle-centric connected services (e.g. predictive navigation) are driven by higher connected car penetration and corresponding demand. However, willingness-to-pay per service quickly declines as customers get used to it (commoditization).

Provision of “5th screen” content (e.g. content shown within the car) offers high GMV, but limited margin potential due to low commissions. **In-vehicle advertising** with some potential, but likely to collide with OEMs brand values.

OEM’s ability to maximize profits from connected features depends often on their pricing strategy and efficiency of data usage.

While car makers have limited direct monetization potential with connected services, they significantly contribute to overall customer experience.
Despite innovation in connected services, the auto industry’s share of value is still low

**Connected services: an evaluation of recent offerings**

<table>
<thead>
<tr>
<th>Digital vehicle service archetypes</th>
<th>Recent service offerings</th>
<th>Key challenges</th>
<th>Value capture potential</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Vehicle features as a Service</td>
<td>• <strong>Pay-by-use vehicle features</strong>&lt;br&gt;- Vehicle-specific add-on services/functions to be digitally booked by vehicle occupants (prerequisite: availability of inactivated components in every vehicle)&lt;br&gt;- Currently only <strong>limited implementation observed</strong> (e.g. navigation upgrade)</td>
<td>• Identification of <strong>suitable components</strong> to yield healthy cost/benefit relation&lt;br&gt;- Effective definition of price model and price points to <strong>avoid cannibalizing</strong> vehicle option revenues when the car is first sold</td>
<td>• <strong>Limited additional revenue potential.</strong> Mainly one-off revenues as vehicle options are shifted to a later time&lt;br&gt;- <strong>Limited profitability</strong> due to required installation of more kinds of hardware</td>
</tr>
<tr>
<td>2 Vehicle-centric connected services</td>
<td>• <strong>In-vehicle voice assistant</strong>&lt;br&gt;- Voice-enabled virtual personal assistants integrated into vehicle infotainment center&lt;br&gt;- Recent <strong>strong customer adoption observed</strong>, focus on <strong>two key use cases:</strong> providing navigation information and initiating phone calls</td>
<td>• Maintaining control over customer data, while sourcing <strong>language processing system</strong> from tech players&lt;br&gt;- <strong>Integration</strong> of voice assistant with customers’ assistants from other domains (e.g. smartphone, smart home)</td>
<td>• <strong>Limited revenue potential,</strong> as similar services are already standard in other domains (on smartphone, at home)&lt;br&gt;- <strong>Strong potential for customer experience differentiation</strong> and links to other in-vehicle services</td>
</tr>
<tr>
<td>3 5th screen connected services</td>
<td>• <strong>In-vehicle marketplace</strong>&lt;br&gt;- <strong>Commerce platform</strong> embedded into vehicle infotainment system&lt;br&gt;- Currently <strong>low technological adoption</strong> in automotive industry, but <strong>accelerating traction especially in the US</strong></td>
<td>• <strong>Partnerships</strong> with merchants and advertisers&lt;br&gt;- Standardized technology platform&lt;br&gt;- Scalability dependent on “additional usable time” enabled by automated driving</td>
<td>• <strong>On-top revenue</strong> possible, but limited to commissions/ad prices&lt;br&gt;- <strong>Negotiation power of global partners</strong> narrows profit potential</td>
</tr>
<tr>
<td>4 Beyond-vehicle services</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5 Data/insights services</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
5G will drive not only new connected services, but also foster shift towards cloud-based vehicle architecture

State of tech: connected vehicle architecture

Implications

- Different vehicle electronics architectures will coexist, but with a clear trend toward in-vehicle centralization

- Car truly becomes “smartphone on wheels”:
  - Software design re-use and software-based innovation
  - Lower complexity and volumes of physical components (e.g. ECUs)
  - Optimization of power consumption across vehicle, cloud, and potentially other vehicles
  - Higher longevity due to ability to physically upgrade

1) QoS = Quality of service
Source: Strategy& analysis
As connected vehicles reach 100% of new cars, technology shifts from 3G / 4G towards 5G readiness

**Market outlook: connected vehicles**

**Connected vehicles** (in total new vehicle sales) – (EU, US, China; in millions)

- Since April 2018 e-Call is compulsory (minimum 2G) in the EU
- Spread of 5G begins in premium and volume segment at the same time
- 4G will only be a temporary solution

- Around 70% of new cars are 5G connected in 2030
- Spread of 5G begins in premium and volume segment at the same time
- 4G will only be a temporary solution

- Connected-Car share 2019 <25%, since only installed in Premium-/JV-vehicles
- Mandatory requirements like V2X or E-Call not yet manifested
- Faster rollout of 5G than in US/EU due to structured rollout in Tier-1 and Tier-2 cities

**Source:** PwC AutoFacts®
Electric cars remain limited by range, outside the high-end market

Overview of powertrain technologies

### Dominant powertrain technologies and respective reach per segment

- **BEV**: Highly attractive for limited ranges
  - Lower battery cell cost is the most important lever for economic attractiveness
  - Increasing energy densities, but ICE range not feasible yet
  - Further functional integration of power electronics

- **ICE**: Increasing costs, unbeaten flexibility/range
  - Mild electrification based on 12V or 48V technology for efficiency gains
  - Further optimization of friction losses
  - Increasingly complex exhaust gas after treatment

- **PHEV**: Complex technology, high cost
  - Increasing minimum electric range for eligibility as a low-emissions vehicle, requiring larger batteries
  - Increasing electric power, driving characteristics becoming more “EV-like”

- **FCEV**: The premium solution
  - Plug-in architecture with fuel cell range-extended BEV expected
  - Best of ICE (high range and fast refill) combined with BEV advantages (zero local emissions), but cost premium persists

Source: Strategy& analysis
Electric vehicle sales boosted by legislation in China and EU

Market outlook to 2030

Electric vehicles (total new vehicle sales – EU, US, China; in millions)

- Around 40 percent of new car registrations electric by 2030
- Sufficient domestic/commercial/public charging infrastructure from 2025 onwards
- Strong legislative push from 2020 onwards
- Cost-of-operating tipping points will vary by segment and pattern of use

- Around 35 percent of new car registrations electric by 2035
- Penetration of electric lower than other regions due to relatively low cost of existing ICE alternatives
- Municipal and state-level privileges support local market dynamics
- Domestic charging infrastructure wide-spread only after 2030

- Around 46 percent of new car registrations electric by 2030
- Sufficient public charging infrastructure from 2022 in priority cities and main travel routes
- Consumer demand for electric vehicles growing from sub-car segments to all segments

Implications

- Efforts to develop and implement ADAS\(^1\) software in vehicles have resulted in higher cost than originally anticipated
- Launch dates for high-level automated driving features have been postponed time and again
- Sensors for ADAS systems are still far from being at target cost level, due to the small quantities being made
- The legal side is also still unclear: the technical framework regulations of the UN/ECE (Economic Commission for Europe) are not yet fully in place: and the approval of Level 3 vehicles for assisted driving on motorways is still not defined

---

1) ADAS = Advanced Driver Assistance Systems

Source: Strategy\& analysis
Automated driving expansion delayed due to higher tech cost and limits on where automated vehicles can operate

### Market outlook

**Autonomous vehicles** (total new vehicle sales – EU, US, China; in millions)

- ~25 percent of new car registrations Level 4/5 autonomy in 2030
- Level 4 expected to be available at low speed and only in restricted areas from 2023
- Road-ready Level 5 cars will not be available before 2028

- Up to ~10 percent of new car registrations at Level 4 possible in 2030 driven by two scenarios
  - Scenario 1: New cars with strong Operating Driving Domain (ODD) coverage (>80% of situations) at L4 expected at <5% of registrations
  - Scenario 2: In addition, L4 cars with lower ODD coverage (~50% of situations) will be sold (e.g. to people mover fleet operators) adding further 5% of new car registrations

- ~20 percent of new car registrations Level 4/5 in 2030, over 40 percent in automated driving-ready cities
- Level 5 will not be available before 2028
- Gradual roll-out of automated driving infrastructure across tiers of cities prolongs adaptation
Automated driving technology market for cars to be worth $270bn by 2030

1) Focus on passenger vehicles, based on end customer prices, 2) M: Mass Market, C: Concept, P: Premium; Source: Strategy& analysis
Regulation will play a key role for adoption and is increasingly supportive for connected, electric and autonomous vehicles

Technology regulation assessment: EU vs. US vs. Asia (China and Japan)

Most relevant regulations (extract)

**Connected**
- Harmonization of connected car standards (e.g. 5G as basic connected car technology, 07/2019)
- Promotion of compulsory & optional connected safety features in vehicles (e.g. Directive 2010/40/EU)

**Electric**
- Incentives to encourage EV purchase (e.g. tax reduction in Belgium, Germany)
- European auto OEMs subject to strict CO2 regulations (e.g. penalties for exceeding fleet emission targets)

**Automated**
- Early global agreements with restrictive regulations for deploying AD technology (e.g. VCRT, 1969); recent favorable regulations permitting testing of AD
- Compulsory regulations enforcing installation of L0 & L1 ADAS features by 2022 (by EU GSR); EU NCAP recommending L2 ADAS safety functions

**Assessment**
- Favorable regulatory dynamics in EU states, promoting the adoption of new technologies, with a focus on compulsory safety and environment-specific aspects
- Technology adoption (with a focus on autonomous) mainly enforced by state-specific regulations, with federal actions protecting the traditional auto industry
- Strict incentives and penalties significantly pushing technology adoption across connected, autonomous and electric vehicles in China and also in Japan

- Strong focus on determining the mandatory ownership rules for data generated by connected autonomous vehicles (e.g. SELF Drive & AV START Act 2017)
- Recent harmful federal regulatory dynamics (i.e. White House’s objective to terminate EV subsidies)
- State-specific electrification developments (e.g. compulsory Zero Emission Vehicle program in California)
- State-specific regulations permitting test & operation of AVs on public roads (e.g. CVC 2012)
- NHTSA’s NCAP with mandatory (e.g. LDW) and recommendation-based installation of basic L2 ADAS safety features (e.g. LCA)

Strategy& | PwC
New roles require suppliers to refocus on selected capabilities

Identifying digital auto priorities

Need for collaboration to stem high costs: tech companies have on average a 10% higher R&D spend than auto suppliers\(^2\)

One German OEM aims to have half of its revenue coming from digital offerings by 2020\(^3\)

Need for omni-channel excellence: e.g. more than 70% of train tickets are already bought online (via app, computer)\(^4\)

Suppliers show strong growth of +450% in M&A activity for software related competencies\(^5\)

Need for optimized global sourcing as labor costs make up ~30% of total interior parts costs when manufactured in Western Europe\(^6\)

Focus of next pages

"Industry workforce will be cut by at least 50% by 2030 and employees who remain will need very different skills"\(^1\)

"Ambidextrous organization"

Performing partnerships

Mixed portfolio

Immersive channels

Smart technology

Hyperlocal footprint

1) PwC Strategy& report “Transforming vehicle production: How shared mobility and automation will revolutionize the auto industry by 2030”
2) Strategy& analysis based on annual reports of several technology companies and suppliers; average R&D spent as percentage of revenue in 2018: 16% tech. vs. 6% supplier
3) Strategy& analysis based on OEM press releases
4) Tagesspiegel press release on Deutsche Bahn tickets
5) Strategy& analysis
6) PwC Strategy& report “Capabilities-driven restructuring – A manufacturing footprint strategy for a commodity automotive supplier industry”
Future organizations need a flexible and hybrid structure

Shifting functional tech expertise and horizontal domain responsibility

**SITUATION:**
- Current R&D methods, tools & processes do not match the increasing complexity of e.g. supporting digital trust and AI
- New business models may include hardware, software and services (e.g. being an automated vehicle “platform provider”) and require realignment of processes

**SOLUTION:**
- Hybrid organizational structure with horizontal and vertical business units for a flexible overarching coordination
- Mix of new and existing capabilities ensures integration and continuous improvement of skills, technology and portfolio

**SUCCESS FACTORS:**
- End-to-end solutions
- Open interfaces
- Adaptation flexibility
- Technology integration
- Talent for emerging skillsets

**Source:** Strategy& analysis

**Strategy& | PwC**

New capabilities required  Based on existing capabilities

EMS: electronics manufacturing services  OMD: original design manufacturer

Ambidextrous organization
The auto industry’s workforce will also be transformed

Producing connected, automated, shared and electric vehicles requires new roles and skills

- Open sourcing
- Agile methodologies (Scrum)
- Business analytics
- Partnership management
- Sustainability
- Productivity
- AI
- Raw materials sourcing
- Real-time data management
- Footprint optimization
- Lifetime CRM
- Omni-channel
- UX/CX
- User interface/graphic design
- Stakeholder management
- Predictive maintenance
- Ethics
- Welfare
- Work-life balance
- Blockchain
- Business development
- Program management
- Cyber (security)
- Data analytic/science/mining
- Software development
- Machine learning
- Cloud computing
- Software-as-a-service

In-demand roles and typical salaries:

- Application architect ($132,000⁴)
- Software engineer ($121,000⁴)
- Product manager ($119,000⁴)
- Business intelligence developer ($104,000⁴)
- Scrum master ($103,000⁴)
- Product owner ($101,000⁵)
- ERP business analyst ($99,000⁴)
- Systems analyst ($91,000⁴)
- Research scientist ($86,776⁵)
- Machine learning engineer ($142,000)
- Supply chain & logistics manager ($117,600⁶)
- AI specialist ($105,918⁶)
- Process automation specialist ($101,650⁷)
- Industrial mechanical engineer ($91,650⁷)
- Product designer ($121,500⁳)
- Product marketing manager ($90,000⁷)
- Customer success manager ($88,500⁷)
- Service and solution designer/ ($71,000⁷)
- Enterprise account executive (third most in-demand job, $182,000³)
- Engagement manager ($130,000³)
- Enterprise account executive (second most in-demand job, $200,000²)
- Solution architect ($139,000³)
- Data scientist (first most in-demand job, $130,000³)
- Information technology lead (121,000³)
- Cloud architect ($92,500⁴)
- Quality assurance engineer ($82,000⁴)

Top courses of study and universities:

- Software engineering
- Civil engineering
- Technical engineering
- Artificial intelligence (AI)
- Mechanical engineering
- System engineering
- Electrical engineering
- Industrial engineering
- Digital media design
- Virtual reality
- Communication
- Psychology
- Business administration
- International management
- Information technology
- Software/network engineering
- Knowledge engineering
- Computer science engineering

Systematic upskilling needed to bridge digital skills shortage

Six steps to providing your people with the right training for the digital future

1. **ANALYZE & DEFINE**
   - Analyze future required skills and resources
   - Identify the individual resource situation and potential shortages
   - Define the initiative based on gap analysis and commitment to developing the team

2. **DESIGN**
   - Design each course within an overall upskilling initiative to keep the focus on your strategic goals
   - Design a timeline for the initiative

3. **ASSESS & ADVISE**
   - Assess individual skill levels
   - Create individual skills development plans to address the new requirements

4. **MATCH**
   - Identify potential candidates for difficult-to-fill positions who would not immediately think to join an upskilling initiative

5. **SET UP & SELECT**
   - Set up curriculum with online and offline modules
   - Select training courses and providers
   - Involve experts and universities
   - Organize expert groups for discussions

6. **MONITOR & OPTIMIZE**
   - Set up continuous internal communication, publishing success stories and communicating the benefits to the broader community
   - Continuously improve the initiative

**PRACTICAL EXAMPLES:**

- A shortage of specific skills and resources, e.g. data strategists and scientists
- Establish a data and analytics ‘university’ to train people and create your own resources
- Define the overall objectives, requirements and timeline of the initiative
- Design the curriculum of the data & analytics ‘university’
- Identify people who are already working in data roles
- Create individual plans to upskill them to the level of data strategists/scientists
- Assess the positions you need to fill and match them with resources
- Broaden internal recruiting and benefits initiatives
- Involve universities and external experts
- Organize secondments to other companies / startups, cross-departmental projects
- Implementation of program increment (PI) planning, market places and other methods to ensure continuous exchange
- Implement agile communication tools
